

Antidepressant Medications

Contributor: Amin Hajamohideen

Reviewer: Shefani Perera

Class	Drug	Indications	MoA	Contraindications / precaution	Side Effects	Other
<p>SSRIs (Selective Serotonin Reuptake Inhibitors)</p> 	<p>Fluoxetine (Prozac): young person, longest half-life, 7 days (less withdrawal effects)</p> <p>Sertraline (Zoloft): Safe in pregnancy, post-MI</p> <p>Escitalopram (Lexapro): elderly, well-tolerated, less nauseous</p> <p>Citalopram (Celexa)</p> <p>Paroxetine (Paxil)</p> <p>Fluvoxamine (Luvox)</p>	<p>1st line for depression and anxiety (GAD, OCD, PTSD)*</p> <p>PMDD*</p>	<p>Selectively inhibits reuptake of 5HT</p>	<p>Hx of mania or suspicion of BPAD*</p> <p>Risk of serotonin syndrome (↑5HT: SNRI, MAOI, TCA, triptans, cocaine, St John's wort)</p> <p>Warfarin</p> <p>Fluoxetine contraindicated in hepatic impairment and breastfeeding</p> <p>Fluoxetine and paroxetine contraindicated with TCA due to CYP enzyme</p> <p>Paroxetine contraindicated in pregnancy (teratogenic, risk of cardiac abnormalities, persistent pulmonary HTN)</p> 	<p>General</p> <ul style="list-style-type: none"> Initiation syndrome: short-term increased suicide risk (highest in first 1-2 weeks, improves after 10 days, requires close monitoring). Symptoms include: (psychiatric/ behavioural) increased suicidal thoughts, anxiety, agitation, insomnia, irritability, (other) nausea, diarrhoea, weight/appetite loss, sweating/flushing/tremour, headache, dizziness, sedation Discontinuation syndrome: FINISH (Flu-like sx, Insomnia, Nausea, Imbalance, Sensory disturbance, Hyperarousal) Serotonin syndrome: SHIVERS (Shiver, Hyperreflexia, Increased T, Vital signs unstable, Encephalopathy, Restlessness, Sweating) Sexual dysfunction SIADH hyponatremia Stroke and bleeding risk <p>Specific</p> <ul style="list-style-type: none"> Fluoxetine: anorexia, initial weight loss, persistent pulmonary HTN Escitalopram: long QT, less weight gain, agitation, insomnia Citalopram: long QT Paroxetine: Birth defects, hyponatremia, bone fracture, acute closed angle glaucoma, shortest half-life, seizure Sertraline: GIT bleeds, Sedation or change HR, cause high BP, glaucoma, lower threshold for seizures, unstable BSLs (diabetes) Fluvoxamine: Highly sedative, taken in PM 	<p>Takes 4-6 weeks to reach therapeutic effect</p> <p>At 6 weeks, monitor sodium levels</p> <p>Monitor LFTs due to hepatic metabolism</p> <p>If on fluoxetine and switching to another SSRI, allow 7-day washout period due to long-half life of fluoxetine</p> <p>Add bupropion if sexual dysfunction</p> <p>Taper over several weeks to prevent withdrawal syndrome</p>

<p>NARIs (Noradrenaline Reuptake Inhibitors)</p> 	<p>Reboxetine (Edronax)</p> <p>Atomoxetine - (Used in ADHD)</p>	<p>1st line for depression</p> <p>*Atomoxetine not recommended as 1st line</p>	<p>Inhibits reuptake of noradrenaline & adrenaline</p>		<p>General Insomnia, sweating, headache, fatigue, nausea, dry mouth, and constipation</p> <p>Increases noradrenaline and adrenaline - increased HR & BP</p>	
<p>NaSSA (Noradrenergic and Specific Serotonergic Antidepressant)</p> 	<p>Mirtazapine (Avanza)</p> <p>Mianserin</p>	<p>1st line for depression</p> <p>Buzzword: elderly, insomnia, loss of appetite and weight loss</p>	<p>Inhibits α_2 (Alpha-2) - adrenoceptors, resulting in increase of NA/5HT without anticholinergic effects or cardiotoxicity</p>		<p>General</p> <ul style="list-style-type: none"> • Sedation (taken in PM) • Dry mouth, weight gain • Sexual dysfunction (uncommon) • Associated with less nausea (due to 5HT3 blockage) • hypertensive urgency with MOAI <p>Rare Blood dyscrasias</p> <p>Specific Mianserin: Agranulocytosis</p>	<p>Do not cease abruptly - risk of discontinuation syndrome</p> <p>Safe for patients with heart disease. But it is not first line because it is associated with weight gain</p>
<p>Melatonergic Agonist</p> 	<p>Agomelatine</p>	<p>1st line</p> <p>Can be considered for major depression, used to treat insomnia, sexual dysfunction in some cases</p>	<p>Unclear. Melatonin receptor (M1 and M2) agonist and 5HT2C receptor antagonist</p>	<p>Inhibitors of CYP1A2 (Fluvoxamine) – increases agomelatine concentration and side effects</p> <p>Avoid in people with liver disease</p>	<p>Serotonergic: Similar to SSRI</p> <p>Does not appear to have any abuse potential or withdrawal effect</p>	<p>High risk of hepatotoxicity</p> <p>LFTs need to be monitored regularly at the start of treatment</p> 
<p>NDRIs (Noradrenaline Dopamine Reuptake Inhibitors)</p> 	<p>Bupropion</p> <p>*Not commonly used in Australia for depression</p>	<p>Only indicated in Australia for smoking cessation</p>	<p>Blocks the action of the noradrenaline transporter and dopamine transporter</p>	<p>contraindicated in patients with bulimia or anorexia nervosa</p>	<p>Risk of seizures (lowers seizure threshold)</p> <p>Tachycardia, palpitations, dry mouth, weight loss, insomnia, agitation, and headache.</p> <p>Advantages: No sexual dysfunction, weight gain or orthostatic hypotension</p>	<p>Can be used as an adjunct to SSRI to improve sexual function</p>

<p>SNRIs (Serotonin and Norepinephrine Reuptake Inhibitors)</p> 	<p>Duloxetine (Cymbalta): also for neuropathic and chronic pain</p> <p>Desvenlafaxine (Pristiq): for post-menopausal women with hot flashes</p> <p>Venlafaxine (Effexor)</p> <p>Milnacipran (Joncia)</p>	<p>2nd line for depression</p> <p>Useful for severe depression, melancholia</p> <p>Useful for chronic or neuropathic pain</p> <p>(Duloxetine)</p> <p>Venlafaxine is good for rx-resistant depression</p>	<p>Inhibits reuptake of serotonin (5HT) and noradrenaline (NA)</p>	<p>cardiovascular disease (CVD)</p> <p>Hx of mania or suspicion of BPAD</p> <p>Risk of serotonin syndrome (↑5HT: SNRI, MAOI, TCA, triptans, cocaine, St John's wort)</p> <p>Duloxetine contraindicated in hepatic impairment</p>	<p>General</p> <ul style="list-style-type: none"> Initiation and discontinuation syndrome similar to SSRIs Additional NA effects: HTN, palpitations, Takotsubo cardiomyopathy, constipation, dry mouth, headache, sweating Insomnia, strange dreams, nightmares <p>Specific</p> <ul style="list-style-type: none"> Desvenlafaxine/Venlafaxine: hypersensitivity rash Venlafaxine: short half-life - withdrawal symptoms with missed doses. Increased risk of seizures 	<p>Hepatic metabolism - monitor LFTs</p> <p>Venlafaxine dangerous in overdose (more so than SSRIs) - increased mortality, cardiac complications, seizure risk</p>
<p>TCAs (Tricyclic Antidepressants)</p> 	<p>Desipramine</p> <p>Amitriptyline</p> <p>Doxepin – also Tx for itch</p> <p>Imipramine</p> <p>Clomipramine - also Tx for OCD</p> <p>Dothiepin</p> <p>Nortriptyline</p> <p>Trimipramine</p>	<p>2nd line for depression (role in severe or melancholic depression)</p>	<p>Blocks NA reuptake</p> <p>Some can block 5HT reuptake</p> <p>Inhibit H1, α1, M1 receptors.</p> <p>Some also block 5HT_{2C}, 5HT receptors and voltage-sensitive Na channels.</p>	<p>BPH (urinary retention)</p> <p>CVD</p> <p>High risk of suicide (fatal OD)</p> <p>Hx of mania</p> <p>Driving/heavy machinery (due to sedation)</p>	<p>Lethal in overdose</p> <p>Serotonergic: Similar to SSRI</p> <p>Blockade of α1-adrenoceptors: postural hypotension</p> <p>Antihistaminergic: sedation, weight gain</p> <p>Anticholinergic: anti-SLUDGE (dry mouth, dry eyes and blurry vision, urinary retention, constipation + GIT disturbances, emesis), glaucoma</p> <p>Blockade of cardiac fast sodium channels: cardio toxic in overdose e.g. arrhythmias, regular broad complex tachycardia, long QT, may lead to VT/VF especially if QT prolongation, mydriasis, dry skin and urinary retention.</p> <p>CNS toxicity: seizures, mental state changes</p> <p>Sexual dysfunction</p> <p>Amitriptyline exacerbates closed-angle glaucoma</p> 	<p>4-6 weeks to reach therapeutic effect</p> <p>Baseline ECG before starting</p> <p>Treatment of overdose: IV sodium bicarbonate</p>

<p>SM (Serotonin Modulator)</p>	<p>Vortioxetine</p>	<p>2nd line Can be considered for severe depression</p>	<p>Acts as an agonist at some serotonergic subtypes and antagonist at others</p>	<p>MAOIs – may contribute to serotonin syndrome</p>	<p>Serotonergic: Similar to SSRI</p>	<p>Given at PM Enhanced cognition</p>
<p>MAOIs (Monoamine Oxidase Inhibitors)</p>	<p>Nonselective (5-HT, DA, NE) Tranylcypromine phenelzine Isocarboxazid (irreversible)</p> <p>MAO-A (5HT, NA) Moclobemide Clorgyline (reversible)</p> <p>MAO-B (DA) Selegiline (irreversible)</p>	<p>Moclobemide & nonselectives 3rd line for depression 1st line for atypical depression</p> <p>Moclobemide useful for mild/mod depression with anxiety</p> <p>Nonselective useful for melancholia, atypical depression, and treatment resistant depression</p> <p>MAO-B useful in Parkinsons</p>	<p>Nonselective inhibitors of MAO-A and MAO-B: inhibits breakdown of adrenaline, NA, 5HT, DA - increase these levels</p> <p>Reversible MAOIs selectively and reversibly inhibit MAO-A</p> <p>Selegiline: selective MAO-B inhibitor → inhibit breakdown of DA → increases DA</p>	<p>Risk of serotonin syndrome (↑5HT: SNRI, MAOI, TCA, triptans, cocaine, St John's wort)</p> <p>Cheese, alcohol, aged foods</p> <p>High risk of suicide (increased risk of death)</p> 	<p>Hypertensive crisis (MAO-A only): cheese reaction due to interaction of MAOI and tyramine</p> <p>Serotonergic: Similar to SSRI</p> <p>Noradrenergic (α1-adrenoceptors): postural hypotension</p> <p>Anticholinergic: anti-SLUDGE (dry mouth, dry eyes and blurry vision, urinary retention, constipation + GIT disturbances, emesis)</p>	<p>Avoid foods with tyramine while on medication, and for 2 weeks after ceasing</p> <p>Can see response in a few days</p>
<p>SARI (Serotonin Antagonist and Reuptake Inhibitors)</p>	<p>Trazodone</p>	<p>Adjunctive</p>	<p>Serotonin antagonist and reuptake inhibitor. At lower doses, has hypnotic action</p>		<p>Trazodone causes priapism, sedation, orthostatic hypotension, nausea</p>
